

Existing Configuration.
...it works, but....

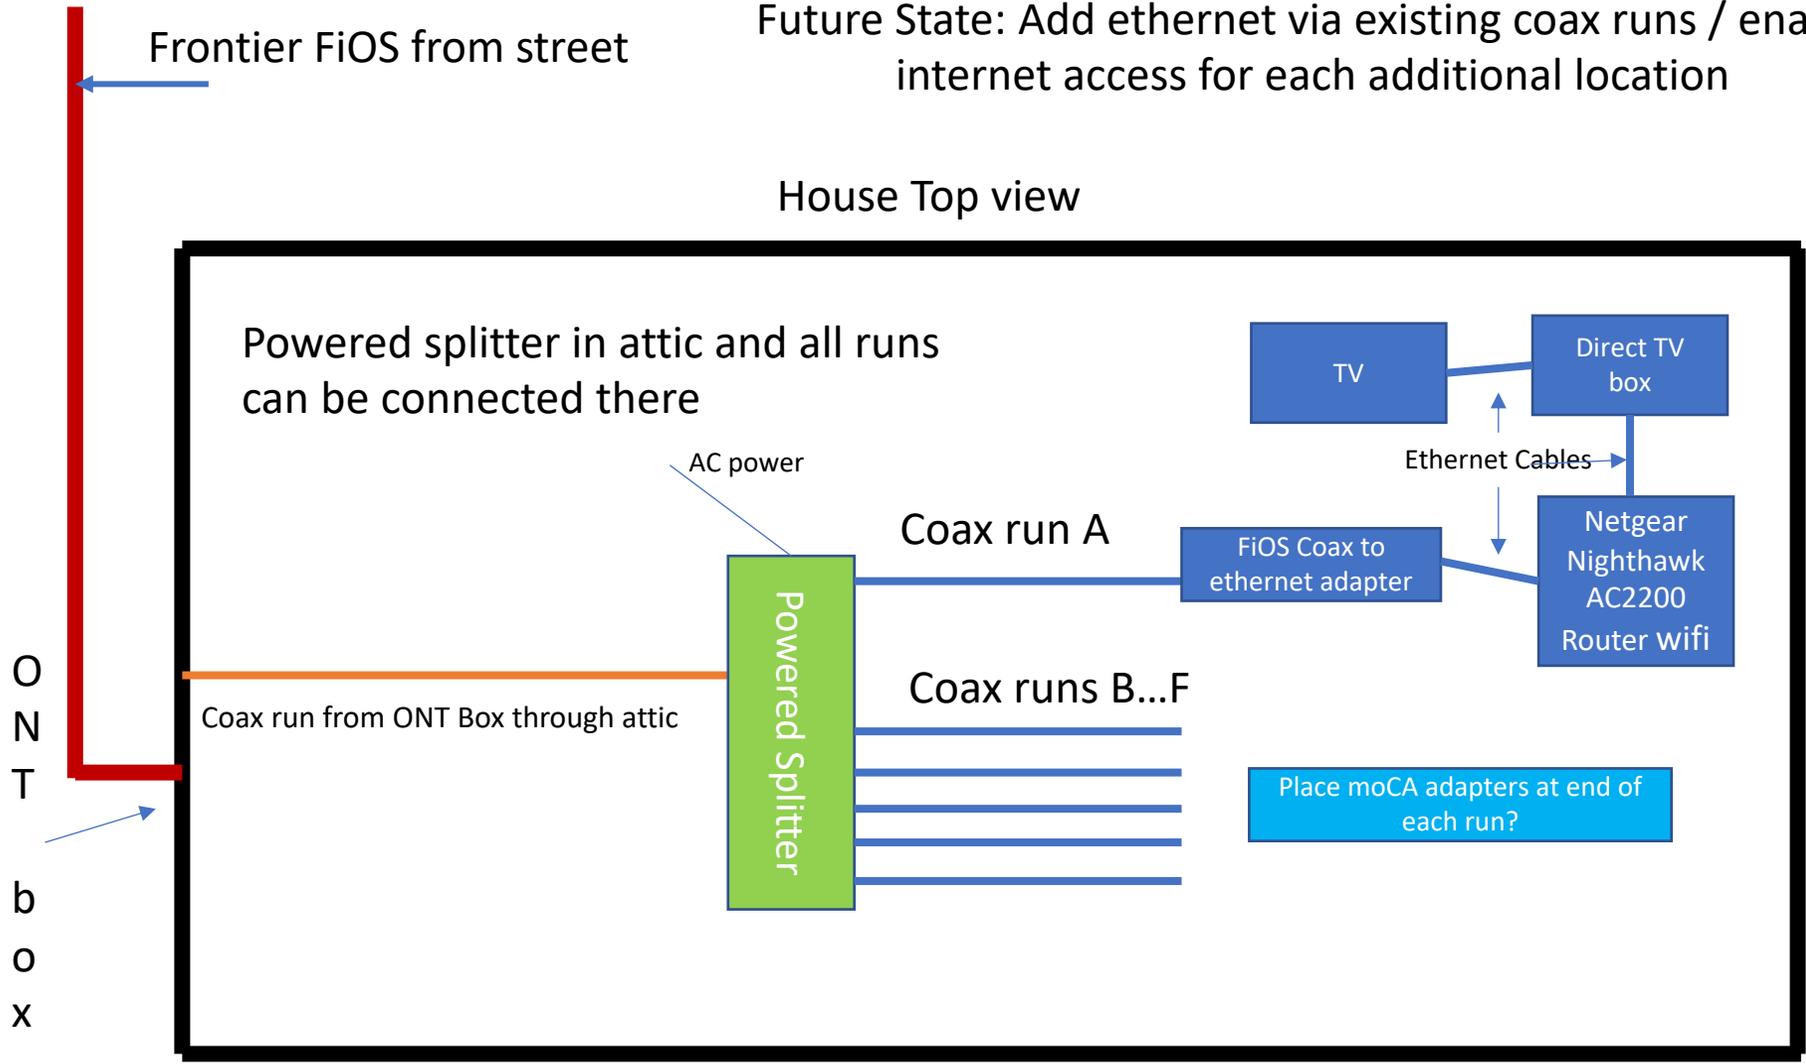

House Top view

- No set box tops
- Just 1gb FiOS into house
- Currently one coax line to family room
- Fios adapter connects to AC2200 router which blasts wifi through house, has cat5 cable to DirecTv box

Future State: Add ethernet via existing coax runs / enable internet access for each additional location

House Top view

- Does FiOS supplied coax to ethernet device need to be relocated to just after the powered coax splitter in attic?
- All runs tested for continuity

* Where should FiOS supplied device be located? Does it matter?

- Have 4 Scream Beam MoCA 2.5 (# 7250) adapters – where to locate?
- Have 3 additional Nighthawk Routers that can be used
